

Species

Phenomenon

Weak Reshuffling

- Opto stim to E cells causes net excitation: ($E[\Delta r] > 0$)
- However, typical opto responses are
 - Much larger than mean opto response: ($\text{Std}[\Delta r] \gg E[\Delta r]$)
 - Large, comparable to typical visual responses: ($\text{Std}[\Delta r] \approx \text{Std}[r_V]$)

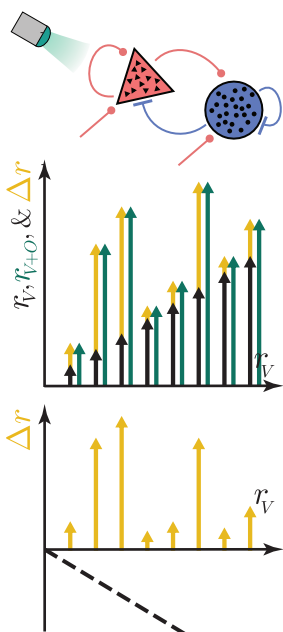

Strong Reshuffling

$$(E[\Delta r] \approx 0)$$

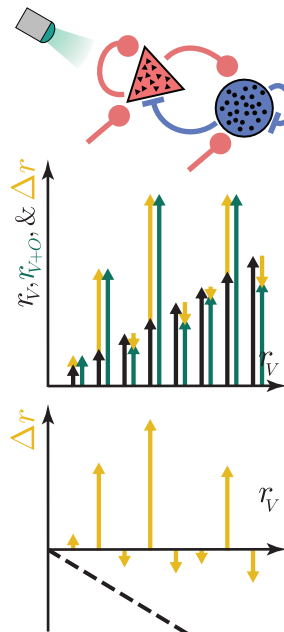

$$(\text{Std}[\Delta r] \approx \text{Std}[r_V])$$

Mechanism

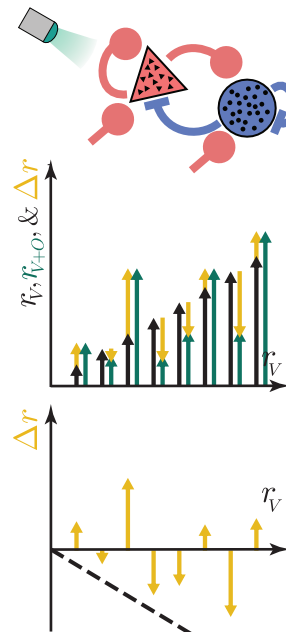

Weak Coupling

Moderate Coupling

Strong Coupling

- No correlation between visual response r_V and opto response Δr

The strong coupling required for strong reshuffling can be more biologically plausible (weaker) with structured connectivity than with random connectivity
